New material quality: BaCo Seal DryPro 3.2

With the new BaCo Seal DryPro 3.2 we have included an innovative material quality in our product range which is suitable especially as seals for aluminium, tinfoil and non-tempered or uncoated glass. Another special feature is that the sealing is created at low temperatures and pressures using the heat contact process and that no induction unit is required. In addition, DryPro can be used universally and provides excellent sealing properties, much better than PE, PP, PET, PS, SAN and PVC. This material quality is primarily suitable for dry, powdery or grainy charges. After prior tests it can also be used for sealing alcohol, pastes and to a limited extent also products containing milk. BaCo Seal DryPro 3.2 is not suitable for greasy or oily charges. Please get in touch with us if you have any enquiries or require further information.

Aluminium seal with integrated valve

For an Italian coffee producer we have developed a new aluminium seal with an integrated valve. Through this an outgassing of the coffee beans is possible, without air entering the container. This is especially useful for all gassing products inside solid containers. This demonstrates that we are always working on developing solutions that meet our customer's full requirements, and for such special customized solutions we are always the right partner.

New manual sealing device Polymat HD III

Our new manual sealing device HD III is suitable for sealing large volume plastic containers and container openings. It is fitted with

- A powerful single-hand sealing head
- A digital temperature control with error messaging
- A table top stand with hanging device
